Re: Trial Sets 8 and 9

Message ID: 2-10-18-36-54-86 ☒

Notes:

Drs. Simons, Richards, McDonald, Anderson, and Cavelier were in charge of these trial sets.

Nanoparticles of serial numbers 59, 53, 30, and 99 were used on the 49 trial subjects.

Initially only 6 trial subjects showed any sign of mal-effect, about average per trial.

2 of those met their demise within the first week (higher than usual).

Dr Richards noted that 42 of the nanoparticles remaining from the serial batch 53 were showing signs of mal-function while still in solution, but attributed it to improper sealing.

Nothing further was reported until 16 people were dead and 22 more were showing signs of decline.

These numbers more than tripled any previous problems. Indeed more than 75% of every previous trial was an unparalleled success.

Overall 39 people died and none of the test subjects received any benefits from treatment.

An investigation will take place regarding the deaths in these trials.

Profiles of the 49 test subjects:

Ages from 19-54

Time since disease was contracted varies

Of both genders

Mostly uneducated

Severity of illness varied
